## ВВЕДЕНИЕ

**Цель работы** – овладеть практическими навыками создания таблиц базы данных PostgreSQL 1X, заполнения их рабочими данными, резервного копирования и восстановления БД.

### **Практическое задание:**

- создать базу данных с использованием pgAdmin 4 (согласно индивидуальному заданию),
- создать схему в составе базы данных,
- создать таблицы базы данных,
- установить ограничения на данные: Primary Key, Unique, Check, Foreign Key,
- заполнить таблицы БД рабочими данными,
- создать резервную копию БД,

### **Указание:**

Создать две резервные копии:

с расширением CUSTOM для восстановления БД;

с расширением PLAIN для листинга (в отчете);

при создании резервных копий БД настроить параметры Dump options для Type of objects и Queries.

- восстановить БД.

## **1 Выполнение**

### **1.1 Название создаваемой базы данных**

Название базы данных - «Курсы».

Изучение предметной области:

База данных разрабатывается для сети учебных подразделений НОУ ДПО, организующих программы внебюджетного образования.

Основная задача системы — составление расписания, поддержка образовательных программ краткосрочных курсов, направленных на повышение квалификации и профессиональную переподготовку в области ИТ.

Курсы включают теоретические и практические занятия по различным дисциплинам и завершаются аттестацией с выдачей документа об окончании.

Необходимый минимальный набор данных для хранения охватывает информацию о студентах, программах, дисциплинах, группах, преподавателях и учебных ресурсах (аудиториях и расписании занятий).

### **1.2 Схема инфологической модели данных БД в нотации IDEF1X**

Для создания базы данных использовалась схема модели из лабораторной работы 2 (рисунок 1).

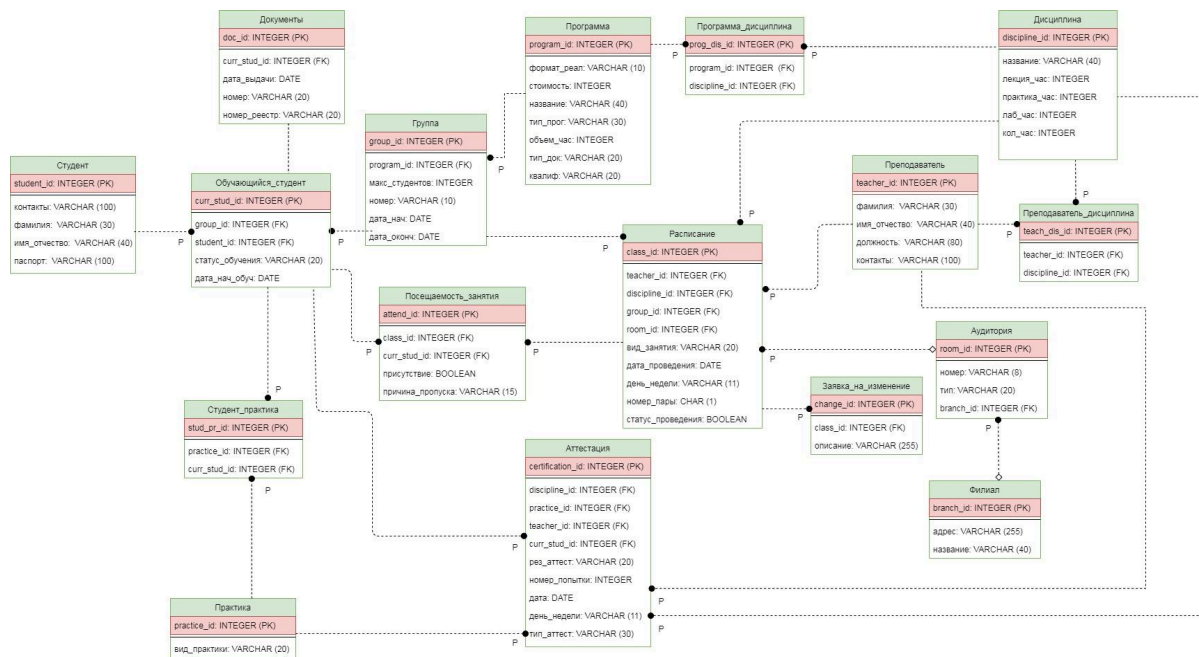

Рисунок 1 – Схема инфологической модели данных БД в нотации IDEF1X [1]

### 1.3 Схема логической модели базы данных (Generate ERD)

Логическую модель базы данных, построенную в результате выполнения лабораторной работы вы можете увидеть на схеме, сгенерированной в Generate ERD (рисунок 2).

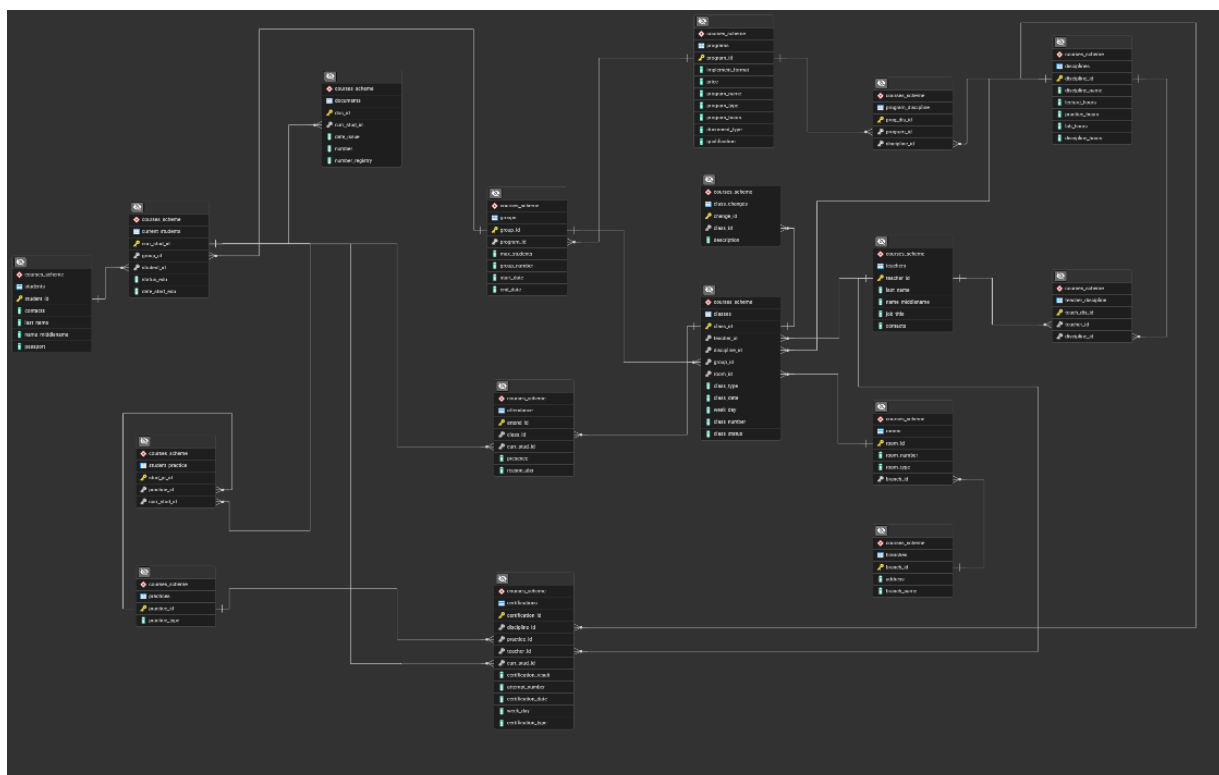

Рисунок 2 – Схема логической модели базы данных, сгенерированной в Generate ERD [2]

Проанализированы составные ключи сущностей в ИЛМ и были заменены суррогатными простыми ключами таблиц в реализации БД ещё при выполнении лабораторной работы 2.

#### 1.4 Создание резервной копии БД.

Были созданы 2 резервные копии БД: с расширением CUSTOM (на GitHub) и с расширением PLAIN для листинга.

Листинг:

## **1.5 Восстановление БД**

С помощью файла резервной копии формата CUSTOM восстановили нашу БД (рисунок 3).

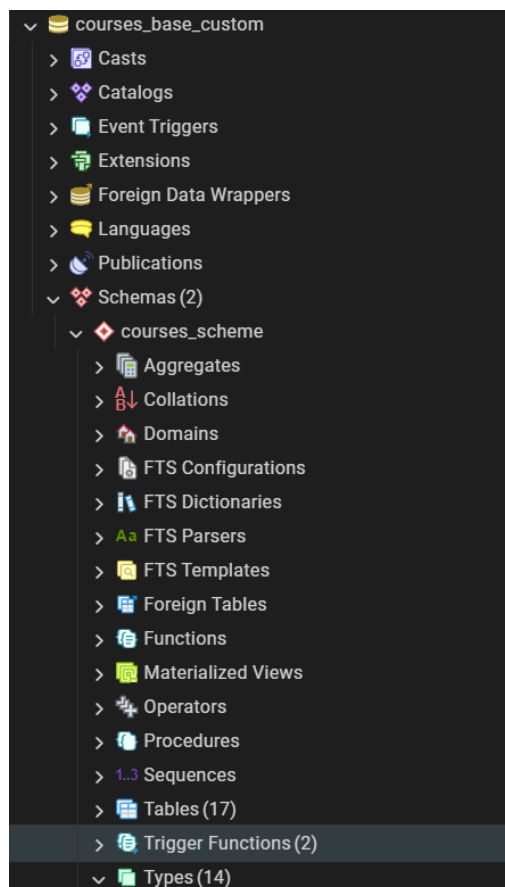

Рисунок 3 – Восстановленная база данных

## ЗАКЛЮЧЕНИЕ

В ходе выполнения лабораторной работы была успешно достигнута цель – овладение практическими навыками создания таблиц базы данных PostgreSQL, их заполнения рабочими данными, а также резервного копирования и восстановления базы данных. Работа включала следующие ключевые этапы:

- 1) создание базы данных "Курсы" с использованием pgAdmin 4,
- 2) создание таблиц базы данных с соответствующими ограничениями, такими как Primary Key, Unique, Check и Foreign Key, что обеспечило целостность данных и их соответствие бизнес-правилам,
- 3) заполнение таблиц БД рабочими данными с использованием SQL-запросов, что позволило проверить корректность и полноту модели,

- 4) осуществление резервного копирования базы данных в двух различных форматах (CUSTOM и PLAIN) для различных типов восстановления, с настройкой параметров Dump options,
- 5) восстановление базы данных, что подтвердило корректность выполнения всех этапов работы и возможность восстановить данные из резервных копий.

**Выводы:** В результате выполнения лабораторной работы была приобретен опыт в создании и управлении базами данных в PostgreSQL. Я овладела важными аспектами работы с СУБД, включая создание базы данных, проектирование таблиц с ограничениями и их заполнение, а также работу с резервными копиями и восстановлением данных. Кроме того, я научилась эффективно использовать инструменты pgAdmin для управления базой данных и выполнения операций резервного копирования и восстановления.

Пройденный процесс моделирования данных и работы с реальными данными в контексте образовательной системы позволил развить навыки проектирования данных для реальных приложений и систем. Выполнение работы углубило знания в области работы с СУБД PostgreSQL и научило использовать различные методы защиты и восстановления данных, что является важным навыком для создания надежных и масштабируемых информационных систем.

## СПИСОК ИСПОЛЬЗОВАННЫХ ИСТОЧНИКОВ

1. Схема инфологической модели данных БД в нотации IDEF1X – URL:
